Youngstown. O. May 7th 1891

Dear Prof Watson

I mail you today a violet, I found yesterday in Trumbull Co. O. that I presume is only an uncommon form of V striata, but you will see the spur is very much curved. I never came across it like this before. I see no other points that differ from V striata, except that it is nearer white, the bracts are closer to the flowers and the stipules are not quite so much fringed, but then these are some of them constant in V striata. Still I thought I would send it. I saw a V Lastata a few days since, gathered nine miles. Trumbull Co. O. but when I went for it yesterday, I found the ground had been burned over, so I shall have to wait another year for it. I also found a second station (in Trumbull Co) for Dio cristata, several miles from the other I reported to you. The second station is small though, I think not more than a dozen roots.

Yours Truly

R. H. Ingoldsby
